**Predictive Services Discussion**: In the wake of a significant wetting precipitation event across the western U.S., temperatures will attempt to climb back toward seasonal normals today as a drying trend develops over the southwest quarter of the Nation, including California and the Great Basin. An upper level trough of low pressure moving through the Mississippi Valley will be accompanied by a strong cold front that could produce severe weather over the central Plains region. Widely scattered showers and thunderstorms will extend along this frontal boundary through the southern Plains and southern Rockies as well. A subtropical wave over the Florida peninsula will continue to produce heavy rainfall as it moves east toward the Atlantic coast.

## Safety Zones 2 (LCES)

*Operational Engagement Category*

Safety Zone(s) are locations where the threatened firefighter may find refuge from the danger. Unfortunately shelter deployment sites have been incorrectly called safety zones. Safety zones should be conceptualized and planned as a location where no shelter is needed. This does not intend for the firefighter to hesitate to deploy their shelter if needed, just if a shelter is deployed the location is not a tree safety zone. Fireline intensity and safety zone topographic location determine safety zone effectiveness.

- How have you determined the distinction between a safety zone and a deployment zone?
- Is refuge in a vehicle, house an acceptable tactic?
- Consider access to the incident. You are often confronted with considerable distances of unburned fuel to cross. How do you manage LCES?
